## The Copper Voluntary Risk Assessment

Working with public authorities to ensure the safe production and safe use of copper products

EUROPEAN COPPER INSTITUTE www.eurocopper.org

Copper can continue to be recycled over and over again with no loss in its performance and qualities.

- Copper is naturally antibacterial and so inhibits the spread of harmful bacteria in water and air distribution systems.
- Copper is an essential trace mineral present in all body tissue. Along with iron, copper helps in the formation of red blood cells and keeps blood vessels, nerves, the immune system, and bones healthy.
- Copper products have useful life cycles ranging from a few months in consumer electronics, up to centuries in architectural applications.

## Did you know that?

Copper products are at the heart of the EU's conventional and renewable electrical energy systems, they help deliver clean drinking water and facilitate modern transportation and communications networks. Copper is also an essential nutrient, ensuring the health and well-being of people across the globe.

The safety of copper production and use has been confirmed by the industry's "Voluntary Risk Assessment" (VRA) performed, between 2000 and 2008, in cooperation with the Italian Government's Istituto Superiore di Sanità.

This proactive, voluntary initiative of the industry was fully endorsed by the EU authorities in April 2008. It was also the first example of its type in Europe to be completed in advance of REACH, the new European Union's regulation on chemicals.

Recognised and accepted by the scientific community and by the EU regulatory authorities, the VRA provides a comprehensive and sound scientific basis on which to assess the safe production and use of copper.

### The VRA:

- → Quantifies copper emissions during production and use
- → Assesses copper exposures to workers, consumers and the environment
- → Recommends safe limit values for the environment and human health
- → Compares all of the above and recommends where additional risk management measures are needed
